**Job title:** Postdoctoral research position investigating biomass harvest and ash recycling  

**Employer** French National Institute for Agricultural Research (INRA)  

**Department & Research Team** Forest Economics Laboratory/Laboratoire d’Économie Forestière  
www6.nancy.inra.fr/lef_eng/  

**Place of work** Nancy, France, and 3 months at SLU/CERE in Umeå, Sweden  

**Duration** 12 months The position will begin on February 1, 2017, or as soon as possible  

**Salary & Working hours** Full time, Approximately 2,600 euros per month (gross salary)  

**Application deadline** 15 December 2016  

---  

### The BAFES/BRECERF project  

**Context**  
Wood fuels are an important energy source in meeting EU’s renewable energy targets. The increased demand for wood fuels has been seen as an opportunity to increase the profitability of forest management by exploiting hitherto unexploited resources. However, the increased use of wood fuel generates also several environmental issues, including the export of nutrients through residues and stump harvests and thereby potential negative impact on forests’ long-term forest productivity. Ash-recycling has been suggested a sustainable remedy for the loss of nutrients. However, there is currently no assessment of about how ash-recycling will influence forest owners’ management, e.g. timber harvest decisions, and the associated changes in the supply of the multiple ecosystem services provided by forests. Furthermore, knowledge about the general population’s acceptability of ash-recycling is almost non-existing.  

**Purpose**  
To develop an integrated framework linking biophysical models and forest owners’ decision processes which allows assessing the impact of ash-recycling on provision of ecosystem services. In particular, we will analyse to which degree the adoption of ash recycling by private forest owners will influence other forest management decisions.  
Assessment of the acceptability ash-recycling and biomass harvesting by the general population and to carry out an economic valuation of associated changes in the provision of ecosystem services. We will, in particular, focus on the impact of ash recycling and biomass harvesting on the value of recreational services as well as investigating the role of scientific information, and the dissemination hereof, for ash recycling acceptability.  

**Approach**  
We develop an integrated model framework where changes in the provision of physical indicators are a function of changes in forest management practices (including ash recycling). This framework is on one hand used to assess the impact of adopting ash-recycling on ecosystem service indicators but also to generate scenarios that is basis for evaluation of the general populations’ acceptability of ash recycling. The integrated framework is based on existing biophysical models, data from experimental plots and from the literature. In the analysis of forest owners’ decision to adopt ash recycling and the associated changes in management we will apply an econometric approach based on survey data of Swedish forest owners, exploiting Sweden has a long experience with ash recycling in forest. The survey of the general populations’ acceptability of ash recycling and the assessment of the economic value of the changes in provision of ecosystem services will be based on surveys and choice experiments in France.  

**Expected results and impacts**  
This project will be the first study to assessment of forest owners’ adoption of ash recycling and to integrate explicitly the feedback on forest management (e.g. changed harvest behavior) of adopting ash recycling and link these changes to provision of ecosystem services. It will also be the first assessment of general public’s preferences for ash-recycling and biomass harvesting in forests and it will contribute to the understanding of the role of information in assessment of the value of ash recycling. This contributes to the design of information campaigns by public agencies or forest owner associations. Finally, the project will establish the basis for carrying out a cost benefit analysis of ash recycling which also includes the impact on non-timber services provided by forests.
